Isolated glial cell derived neurotrophic factor receptor alpha useful to develop products to diagnose and treat associated disorders, particularly enteric nervous system or kidney disorder Claim 1; Page 78-79; 100pp; English.

This protein comprises full-length rat glial cell derived neurotrophic factor receptor alpha (GDNFR alpha), a novel gPI-linked protein that is a ligand-binding component of the receptor system for GDNF. Its amino acid sequence was deduced from an isolated cDNA clone (see T84975). The invention relates to novel uses of GDNF and its receptor. In particular, it relates to native rat GDNFR alpha (see W27327), its variants and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      W27327 standard; Protein; 468 AA.

New variants of lymphadenopathy associated virus (LAV) - used for prodn. of DNA, antigens and antibodies used in diagnosis of AIDS and pre-AIDS Claim 8; Fig 8A-81; 72pp; English.

LAV EL I (N80436) and LAV MA L (N80437) were isolated from the peripheral blood lymphocytes of patients. Different AIDS virus isolates concerned are designated by 3 letters of the patients name. Stable probes including
                                                                                                                                                                                                                                     P80885

The proteins or peptides can be used for detection of antibodies induced in vivo and present in biological fluids. The DNA can also be used for the expression of LAV viral antigens for the prodn. of a vaccine against LAV. The polypeptides can also be used for the prodn. of antibodies for the detection of proteins related to the LAV viruses, partic. for diagnosis of AIDS or pre-AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               fuel gas and feed protein, have specified carbohydrate binding domain Claim 20; Page 45; Tapp; English.

This CBD is homologous to a terminal A region of Trichoderma reesel cellulases and effects binding of a protein to an insoluble cellulosic or hemicellulosic substrate. It is one of ten specific CBD's (see R15244-R15253) which correspond to the generic CBD formulae in R15242 and R15243. The CBD is incorporated into a fusion protein comprising a catalytic domain from a cellulase, e.g. a Bacillus endoglucanase, and optionally comprising a linking B domain from e.g. a fungal endoglucanase.

The invention relates to a method for detecting antibodies to HIV-1, which comprises contacting saliva from a fasting human with immobilised HIV-1 p17 antigen, preferably on a nitrocellulose-containing solid support, and detecting any antigen-antibody complex, optionally with a labelled second antibody. The method can be used to detected exposure of a mammal, especially a human, to HIV-1. Detecting anti-HIV antibodies in saliva is safer as HIV is not transmitted via saliva, as opposed to blood. The assay is simple and cheap to perform without laboratory equipment or trained personnel and can be performed at home by the saliva donor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pure glycoprotein contg. gag amino acid sequences - expressed on pur surface of HIV-infected cells and monoclonal antibodies to the pure glycoprotein, for immunoassay and protecting against HIV infection claim 14; Fig 12; Slpp; English.

CI The synthetic peptides #1-13 were used in epitope mapping studies commoclonal antibodies against pl7. ELIGA plates were coated with recombinant pl7 (rp17) and peptides #1-13 (representing the complete sequence of HTLV-IIIb pl7). Antibodies Gilql and Gilh3 (which react with live HIV infected cells and recognise a glycoprotein contg. a complete gag amino acid sequence and having mol. wt. 150,000 or 90,000, respectively), bound strongly to rp17 but did not bind to any of the peptides tested. The claimed monoclonal antibodies which competitively inhibit Gilgl or Gilh3 are further defined by the fact that they do cont substantially bind to the peptides 1-13. The MAbs can be used to determine the number of HIV-infected cells, to purify gag antigens or can be coupled to a toxin for therapeutic use.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

Treating HIV infection with mutant HIV matrix polypeptide - pref. Produced by transfection with viral vector, inhibiting replication, assembly or infectivity of virus particles. Subsclosure; Fig. IA-IF; 6lpp; English.

CHIV infection is treated by administering to a patient a mutated CHIV matrix (MA) protein using a viral vector. Preferred mutants Care those given in R55851-60. The deletion/substitutions of the mutants either lower the incorporation of Env protein in the viral Courants either lower the incorporation of Env protein in the viral Courants either lower the incorporation of Env protein in the viral Courants either lower the incorporation of Env protein in the viral Courant entry into uninfected cells, disrupt virus assembly, or disrupt virus entry into uninfected cells. The DNA sequence encoding MA Cis given in 066839 and the as sequence in R55850.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       HIV infection is treated by administering to a patient a mutated HIV matrix (MA) protein using a viral vector. Preferred mutants are those given in R55851-60. The deletion/substitutions of the mutants either lower the incorporation of Env protein in the viral particle in HIV infected cells, disrupt virus assembly, or disrupt viral entry into uninfected cells. The DNA sequence encoding MA is given in Q66839 and the aa sequence in R55850.

HIV coding sequences used as source of antigen for Wester blot diagnosis for AIDS, usable directly as bacterial lysate. Disclosure; fig.7; 40pp; German.

This sequence is that of the human immunodeficiency virus-1 (HIV-1) pl7 antigen which is expressed as a fusion protein with a few extra AAs on both ends. The antigen (Ag) can be used in a western blot analysis to detect HIV antibodies in serum or other body fluids. The prepn is both cheap and safe and the Ag is used directly as a bacterial lysate. The directly as a more sensitive and accurate than conventional western blot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ATM gene; ataxia-telangiectasia; progressive genetic disorder; antibody; central nervous system; immune system; chromosomal instability; therapy; cancer predisposition; radiation sensitivity; cell cycle abnormality; multi-system disease; autosomal recessive; cerebellar ataxia; cerebellum; general motor dysfunction; purkinje cell; oculocutaneous telangiectasia; blood vessel; bulbar conjunctiva; facial skin; A-T; mutein.

A comparison of N60287 with the cDNA of the HTLV-III genome revealed one particular clone, designated ps. 21 which contained a DNA sequence encoding this peptide (P60308) sequence. This approx. 2.2 kilobase covers the precursor gag region and encodes, 5' to 3', p-12, p-15, p-24 a second p-15 protein, and approx. 300 extra base pairs 3' to the gag region (see N60288).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence of gag and p24gag.

The protein is encoded by an exemplary coding region for the HIV gag precursor which lacks 3' and 5' flanking sequences. For expression in eucaryotic cells, the sequence is operatively linked to a regulatory element which functions in the selected host cells. Immunogenic particles comprising full-length gag precursor protein are immunologically similar to authentic gag particles. The protein is recognised by anti-p16, anti-p24 and anti-p17 antibodies and lacks functions required for viral maturation and replication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Recombinant DNA construct including replication system recognised by unicellular microorganism - used to form recombinant proteins for diagnosing AIDS and lymphadenopathy syndrome Example 5; Fig 2; 32pp; English.

This sequence was decoded from the gag gene from proviral hTLR DNA. Proteins associated with lymphadenopathy syndrome and/or AIDS may be used in serological immuno-assays to detect antibodies to hTLR. The polypeptides can be used alone or in fusion constructs to produce antisera or monoclonal antibodies which may be used for therapy or diagnosis.

Claim 1; Fig 11; 73pp; English.
The full-length C-family cellobiohydrolase coding sequence was
The full-length C-family cellobiohydrolase coding sequence was
isolated from a F. oxysporum cDNA library by hybridisation to PCR
generated genomic oligonucleotide probes (see esp. Q15502). The
enzyme encoded by the sequence has a CBD which is homologous to a
terminal A region of T. reesei cellulase and is able to bind to
insoluble (hemi)cellulosic substrates. See also Q14839-Q14842.

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

on: Tue Jun 23 18:23:39 1998; MasPar time 23.53 Seconds 721.817 Million cell updates/seconds

Title: >US-08-866-354-2
Description: (1-465) from US08866354.pep
Perfect Score: 3369
Sequence: 1 MFLATLYFALPLLDLLLSAE......PLLVLVVTALSTLLSLTETS 465

Scoring table: PAM 150 Gap 11

Searched: 120441 seqs, 36531193 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: pir56 1:pir1 2:pir2 3:pir3 4:pir4 5:nrl3d

Statistics: Mean 46.109; Variance 80.746; scale 0.571

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Database: swiss-prot35 1:swiss1

Statistics: Mean 47.888; Variance 65.919; scale 0.726

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
